Hi Zac,

I'm reaching out following your attendance at the SecurityWeek Ransomware Resilience and Recovery Summit, where Cohesity shared a breakout on building resilience and ensuring predictable recovery following ransomware incidents. [redacted], I thought it could be useful to compare how universities are assessing recovery readiness today, particularly around clean recovery environments, cyber vaulting, and preparedness should an incident occur. If helpful, I'd welcome a short conversation to share what we're seeing across higher education and to learn how resilience and recovery are being approached within your environment.

Best,
Andrew Bodley

Hi Brian,

I attended SecurityWeek's conference event yesterday (25/02/26) and found your session on Adaptive Security particularly interesting.

I am currently a student at the University of Bath undertaking an Entrepreneurship module. As part of this, my group and I are developing and strategising a venture focused on AI cybersecurity training for financial and corporate institutions.

Given the overlap with Adaptive Security's mission, I would really appreciate any insights you might be willing to share. In particular:

- What do you believe were the key factors that enabled Adaptive Security to gain early traction and become a reputable platform?
- How did you approach prospective clients?
- In the early stages, how did you establish credibility and trust with clients?
- Is there anything you wish you had known before launching?
- What advice would you give to founders entering the AI cybersecurity training domain today?
- Are there common mistakes you see new ventures in this sector make?

Even a brief response would be greatly appreciated as it would help inform our coursework direction.

Thank you again for your talk and for any guidance you can provide.

Regards,
Zac
