Risks/ Uncertainties / constraints

- **Organizational backing:**
 - Endorsement from experts, universities or other respected cybersecurity institutions has been identified as key for the validity of our product, In the current state it is a key constraint for rollout.
 - Essentially This endorsement would be necessary before launch to prove the validity of our product, constraining the launch to after such an endorsement has been achieved.
- **Internally hosted service(data privacy):**
 - Our current thinking of the platform has it as an external platform that isn't internally integrated into a given companies systems, from the received feedback and from a data privacy perspective this could be a constraint as for security reasons companies prefer internally integrated services.
 - Would have to find a way to integrate our service into a company's internal network in order to ease security concerns and reach the biggest possible market.
 - If we were to offer the service externally then there is the risk of handling employee data.
- **Fast pace AI changes:**
 - The AI landscape is one of the fastest changing in the tech sphere, therefore there is always a risk of releasing material that is inaccurate or outdated with regards to the newest versions of AI models. This should be mitigated through constant revisions and monitoring of the AI sphere.
 - This sort of revisioning and monitoring would require a large team.
- **Full Alignment with organizational goals:**
 - In order to gain market share in the cybersecurity training space, the course needs to meet organizational goals of the companies we will be selling to, since these vary widely from company to company it would be difficult to construct a "one-fits-all" course that would satisfy every company.
 - We have a way to resolve this by constructing curated courses that align more closely to the needs of a specific company
- **Redundancy:**
 - As AI evolves it becomes more realistic and it becomes harder to distinguish real from AI, this risks our course becoming redundant when there is physically no difference between AI and real content.

Steps for development, Scaling and Commercialization

- **Development**
 1. Aligning course content plan to institutions and companies we are targeting
 2. Developing V1 version of course content in collaboration with experts
 3. Creating the external website as well as developing the capacity to integrate the course into corporate networks
- **Scaling**
 1. Creating content that extends beyond our target market (from finance to consultancies for example)

2. Reaching out to companies to demo our product (sales)
 3. Attending cybersecurity conferences to demo and sell our product
 4. Could provide a publicly available version of the course for the general public
- **Commercialisation**
 1. Commercialization is already defined for targeted markets, could extend commercialization to the general public by creating a publicly available version of our course
